Propagation is effected by transplanting portions of the root. No doubt other methods are equally as valuable. The plants that I have observed spring from seed obtained from some forgotten source through a magazine advertisement. As a plant for fence or arbor where a permanent vine is needed for summer ornamentation this has the advantage of being a perennial and of making a faster growth in spring and so covering earlier and better. The production of flowers is several weeks earlier than the annual sorts and so gives a longer display.

With purple color present in the flower this might be fertile field for the development of some native flowering vines in several colors.

ELDRED E. GREEN.
